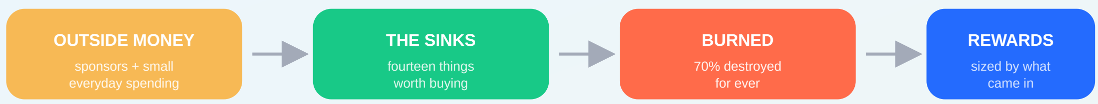
MovenRun

ECONOMY V5 · THE ENGINE · CONFIDENTIAL

Money in, money out, and a game worth playing.

V4's architecture was right. It needed four repairs and a reason to get out of bed. This is both.



Rewards can never exceed what the economy actually took in. That is the whole design.

Prepared for	Version	Builds on	Status
Partner review	5.0 · August 2026	V4 architecture	Design proposal

START HERE

What V4 got right, and what it missed

V4 is the best of the four documents. Its structural core should be adopted almost unchanged.
But it has four repairable flaws, and it forgot that this is a game.

Adopt, unchanged

V4 IDEA	WHY IT IS RIGHT
Base Camp · Residency · Charter	Solves the land collision completely. Personal space is private and instanced; local membership is non-exclusive; only the *operating right* over a zone is scarce. Nobody is ever locked out of where they live.
Adaptive subdivision	Start broad, split a zone into seven only when real demand proves it. Fixes cold start and saturation with one mechanism.
One unit, two states	Locked MOVE and liquid $MOVE share a unit, so prices do not fork into two unrelated economies. This was V3's real mistake, and V4 is right to reverse it.
The mixed-payment rule	The load-bearing fix. Locked balance may pay for play, but **any action creating tradable value must include a real burn.** This is precisely what stops a soft currency hollowing out token demand.
Burn router & honest accounting	Only irreversible destruction counts as a burn. Credit cancellation, escrow and treasury transfers are reported separately. This is more honest than anything we had written.
Spend now, withdraw slowly	Better than our Quick Claim. Full in-game utility immediately; only the exit is paced. Nothing is confiscated.
No passive land yield	Correct. Automatic land income makes early arrivals extract from everyone who comes later.
Burn Vouchers & trust tiers	A genuine no-purchase route that creates a real burn, plus a sensible ladder before anything is withdrawable.

The four repairs

1 · The reward formula collapses

"Emission ≤ 50% of last season's burn" is a shrinking loop. Spend comes from the pool, burn comes from spend, and the next pool comes from burn — each turn is about a third of the last. **It converges to zero.** Section 2 proves it and fixes it in one line.

2 · The demand loop is never named

V4's own base case needs about 80 tokens spent per player but only pays out 58. The missing 22 must be *bought*. That gap is the engine of the whole economy and it is not discussed anywhere.

3 · Land that expires every season

Charters ending after 90 days is economically tidy and emotionally brutal. Our entire pitch is "the ground you cover becomes yours." A right that evaporates four times a year is not ownership.

4 · Nothing left worth wanting

V4 removes passive yield, payback, permanent land and the emission floor — correctly — but replaces them with "reputation and tools". That is not enough reason to walk in the rain.

WHAT V5 ADDS

The four repairs, and then the part every previous version skipped: **fourteen real sinks, a crafting system, collections, expeditions, rivalries, landmarks and clubs** — things players actually want to spend on. A sink nobody enjoys using is not a sink; it is a tax people avoid.

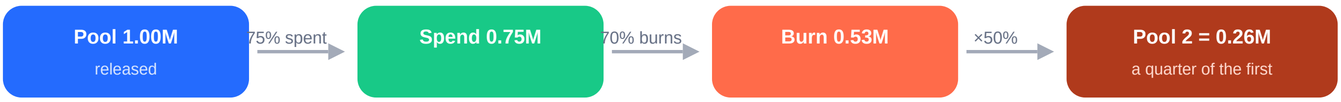
PART 1 · THE REPAIRS

Repair 1 — the formula that eats itself

V4's central safety rule is that new tokens cannot exceed half of what was destroyed last season. The intention is exactly right. The arithmetic does not survive contact with itself.

Why it collapses

Follow one loop. The pool pays out tokens. Players spend some of them. The router destroys 70% of what is spent. Next season's pool is capped at half of that destruction.



Each turn keeps about 35% of the last. After eight seasons the pool is under 1% of where it started.

V4's bootstrap allowance hides this for eight seasons, then it appears all at once.

A closed loop that destroys most of what it circulates cannot refill itself from its own destruction.

The one-line repair

New emission ≤ 50% × (verified burn + outside money that entered)

Sponsor deposits and player purchases are coverage too — they are real value arriving, not tokens recycling.

This is not a loosening of V4's discipline; it is a correction of what "covered" means. A burn proves tokens left circulation. An outside purchase proves someone paid real money to enter it. **Both are evidence that the economy took something in.** Counting only the first measures the exhaust and ignores the fuel.

What the repaired rule settles at

RULE	STEADY STATE
V4 — coverage counts burn only	**Collapses to zero** once the bootstrap ends
V5 — coverage counts burn + outside money	Pool settles at about **1.3× the outside money** arriving each season

That second line is worth reading twice, because it is the honest description of this business: **the reward pool is roughly one and a third times whatever real money the network takes in.** No sponsors and no spending means no rewards. Growing sponsorship and steady everyday spending means growing rewards. Nothing is promised, nothing is printed on hope, and the size of the economy is always an observed fact rather than a forecast.

EVERY PROTECTION V4 WANTED SURVIVES

A hard schedule ceiling still caps issuance. The coefficient still keeps net supply falling. Wash trades, self-cycles and treasury-funded burns are still excluded — and outside money is filtered the same way, counting only settled sponsor deposits and completed purchases. **If real money stops arriving, rewards still fall to almost nothing.** That was the point, and it is intact.

PART 1 · THE REPAIRS

Repair 2 — say out loud who buys

Every version so far has quietly assumed someone is buying the tokens that earners sell. None has said who, or how much, or why they would. That silence is the biggest hole in all four documents.

The gap in V4's own numbers

V4 BASE CASE, 100,000 PLAYERS, PER SEASON	PER PLAYER
Reward pool paid out	58 $MOVE
Spending the model requires	80 $MOVE
Must be bought rather than earned	**22 $MOVE**

Across the network that is **2.2 million tokens of net buying every season**. It is the single load-bearing assumption in the entire model, and V4 never mentions it. So let us design it deliberately instead of hoping for it.

Who the buyer actually is

Not speculators. The free majority.

A player with no deed and no interest in crypto still wants a better zone module, a rare jacket, an expedition entry, a landmark name, or a collection completed before the season ends. Those actions require a real burn. So they buy a small amount of $MOVE — through a fiat button that acquires exactly what the action needs and routes it straight into the burn.

Many small buyers and a few large sponsors on one side; a smaller number of slow sellers on the other. That is an ordinary consumer economy.

How much money is that, really?

SPENDING PER PLAYER PER MONTH	OUTSIDE MONEY PER SEASON	RESULTING POOL	PER PLAYER
$0.20	$1.8M equivalent	2.4M $MOVE	24
$0.40	$2.4M equivalent	3.1M $MOVE	31
$0.75	$3.5M equivalent	4.5M $MOVE	45
$1.50	$5.7M equivalent	7.5M $MOVE	75

At 100,000 players, assuming a $0.10 token and $1.2M of sponsor deposits. **Illustrative — not a forecast.**

> WHY THIS IS ACHIEVABLE RATHER THAN HOPEFUL
>
> Seventy-five cents a month is far below what mobile games routinely earn per player, and it does not require anyone to believe a token will appreciate — only to want a jacket, a name on a landmark, or a place in next week's expedition. **We are not asking players to invest. We are asking them to buy things they want, occasionally, for less than the price of a coffee a month.** Everything in Part 3 exists to make that a genuinely appealing purchase.

PART 1 · THE REPAIRS

Repairs 3 and 4 — give people something to hold

V4 made land safe by making it temporary and worthless to hold. Both moves were aimed at real problems. Both went one step too far.

Repair 3 — tenure that behaves like tenure

THE PROBLEM

A Charter ends after 90 days, every time. Our promise is that the ground you cover becomes yours; a right expiring four times a year is a lease, and players feel the difference.

THE REPAIR — RENEWAL BY CARE, CONTEST BY DEMAND

Keep the seasonal term and the expiry, but change what happens at the boundary. **An active steward renews automatically.** A contest opens only when one of three things is true: the steward went quiet, a qualified challenger stepped forward, or the zone is busy enough to subdivide.

AT THE SEASON BOUNDARY	WHAT HAPPENS
Steward was active, no challenger	**Renews automatically.** No fee, no contest, no anxiety.
Steward was active, challenger qualified	A 14-day contribution contest. The incumbent carries a modest care bonus, capped so it is an edge and not a moat.
Steward went quiet for 21+ days	Open contest. Anyone qualified may enter.
Zone crossed the density threshold	It splits into seven. The steward keeps one child of their choosing; the other six open.

A steward who keeps showing up may hold the same ground for years and never be told to reapply. One who stops is replaced within a season.

Repair 4 — land worth wanting

V4 correctly removed automatic land income, then offered stewards “reputation and tools” instead. For most players that is not a reason to compete for anything.

Pay stewards in capability, not currency

THE PROBLEM

V4 correctly removed passive land income, then offered stewards "reputation, zone presentation and sponsor operations" instead. For most players that is not a reason to compete for anything.

THE REPAIR — PAY STEWARDS IN CAPABILITY, NOT CURRENCY

A steward gets powers that are genuinely valuable and generate no tokens at all.

WHAT A STEWARD GETS	WHY A PLAYER WANTS IT	MINTS TOKENS?
Name the zone	Their name on the map for everyone passing through. The oldest reward in games.	No
Set the look	Colour, banner and style, seen by every visitor.	No
Publish quests	Set challenges for residents, funded from their own balance. Real social power.	No
Run sponsor campaigns	Run campaigns in their zone for a capped share — only when a sponsor funds it.	Only if funded
Host expeditions	Their zone becomes a start or finish point, drawing traffic.	No
Higher capacity	More gear, quest and collection slots. Capability, not income.	No
Heritage record	A permanent tradable record that they held this ground. Provenance without power.	No

THE DISTINCTION THAT MAKES THIS SAFE

Every reward above is **status, capability or access** — never a flow of currency, so nothing mints tokens because time passed. But it gives a steward a great deal to lose, which is what makes contesting a zone matter.

PART 2 · LAND

Three layers, and nobody is locked out

Your question was: what happens when a new player signs up somewhere another player already owns? The answer is that they were never competing for the same thing.

LAYER 1 — PRIVATE

Base Camp

unlimited

Your own space. Personal, private, and not on the shared map at all — so a hundred people in one street each have one and none of them collide. Its exact loca

LAYER 2 — SHARED

Residency

non-exclusive

Local membership in a real zone, earned by visiting it five times in a fortnight. Everyone who walks there can hold it at once. It grants quests, club activity and pı

LAYER 3 — SCARCE

Stewardship Charter

one per zone

The right to *operate* a zone: name it, style it, publish quests, run sponsor campaigns. One per zone. Earned by contribution, renewed by staying active, conteste

Only the third layer is scarce — and it is a job, not a title deed.

So: a new player joins where someone is already steward

THEY IMMEDIATELY GET	NOTES
A Base Camp	Private and instanced. Nobody else's claim can touch it, and it takes nothing from anyone.
Full play in that zone	Movement, score, quests, clubs, progression — from day one, with no permission needed from the steward.
Residency after five visits	Alongside everyone else who lives there. There is no cap on residents.
A route to the Charter	After 30 active days they can contest at the next boundary, or wait for the zone to split.

THE INCENTIVE THAT MAKES THIS GENUINELY PLEASANT

A steward's standing depends on how *alive* their zone is — resident count, quest participation and sponsor appeal all rise with activity. **So a steward actively wants newcomers in their area.** A new player is not a threat to be resented; they are the thing that makes the zone worth holding. That is the opposite of how virtual land has worked everywhere else, and it is the single best property of this design.

The map grows only where people do

Zones start large — one hexagon of about three-quarters of a square kilometre. When a zone reaches roughly forty regular residents or a dozen qualified challengers, it **splits into seven smaller ones** at the next season boundary. The incumbent keeps one of their choosing; the other six open with no incumbency advantage.

No empty map at launch

A new city has few, large, socially busy zones — so early players meet each other instead of scattering across thousands of dead cells.

No permanent lockout at scale

Popular ground keeps producing new charters exactly where demand is highest. Arriving late costs you the best zone, never the chance of one.

Supply follows proof

Scarcity expands only when real people prove they want it — never on a schedule, never by decree.

PART 3 · THE SINK ENGINE

Where the soft balance stops

This is the rule you identified as missing, and it is the most important line in the document. **The locked balance may pay for play. It may never fully pay for anything that creates tradable value or improves access to rewards.**

How much of each action the locked balance may cover

Green = locked balance earned by walking. Red = real tokens, permanently destroyed.

The more an action creates something tradable, the more of it must be paid in tokens that die.

Why this is the fix

Your objection to V3 was exactly right: if a soft currency can buy everything, nobody ever needs the real one, so the token has rewards flowing out and nothing flowing in. This ladder fixes it without taking anything away from free players — **everything that makes the game fun stays fully payable by walking**, and only the things that create tradable value or reward access carry a burn.

A FREE PLAYER CAN, PAYING ONLY BY WALKING	THEY NEED TOKENS ONLY TO
Build their Base Camp, earn Residency, run and complete quests, join and run clubs, craft most gear, enter expeditions, collect badges, customise their look, compete in contests, climb the leaderboard	Activate a Charter, mint a Heritage record, buy advanced modules, or trade on the marketplace — and even then, a sponsor-funded voucher covers one Charter activation per season

THE RULE STATED ONCE, PRECISELY

No action that produces a transferable asset, or that increases a player's share of the reward pool, may be paid for entirely with the locked balance. Every such action carries a minimum burn, and that burn is what the next season's rewards are measured against. Break this rule anywhere and the whole economy leaks.

Fourteen things worth buying

A sink only works if players enjoy using it. Every earlier version had four or five, mostly land-related, mostly one-off. Here are fourteen, spread across every kind of player and every week of a season.

SINK	BURN	WHO BUYS	WHAT THEY GET, AND WHY THEY WANT IT
1 · Gear crafting NEW	20%	most players	Built from materials found in particular terrain. Capability and looks, never score.
2 · Gear repair NEW	20%	most players	Gear wears out. Small, frequent, the most reliable recurring sink in the game.
3 · Expedition entry NEW	30%	many	Multi-day route challenges. The entry fees *are* the prize pot.
4 · Collection minting NEW	70%	completionists	A finished badge set becomes one permanent showpiece. Pure status, pure sink.
5 · Landmark naming NEW	100%	a handful	Auction to name a famous cell permanently. Rare, expensive, unforgettable.
6 · Charter activation V4	20%	stewards	The right to operate a zone for a season.
7 · Zone modules V4	20–50%	stewards	Quest slots, styling tools, sponsor dashboards, district coordination.
8 · Charter insurance NEW	100%	cautious stewards	Recover part of your stake if you lose. Removes the fear of competing.
9 · Club hall NEW	40%	clubs	A shared home with upgrade tiers. Thirty people, one purchase.
10 · Rival duels NEW	30% rake	competitive	Weekly head-to-head with your matched rival. The loser's stake funds the winner.
11 · Season pass NEW	50%	regulars	A season-long reward track. The most predictable revenue in games.
12 · Identity & cosmetics V3	50%	many	Colours, map styles, banners, titles, share cards.
13 · Heritage mint V4	70%	former stewards	A tradable record of ground you once held. Provenance, no power.
14 · Marketplace fee V4	2% of trade	traders	Half burned, a quarter to next season, a quarter to the company.

Why fourteen rather than five

Different players, different sinks

A collector, a competitor, a club organiser and a steward each have something they want. No single mechanic has to carry the whole economy.

Recurring beats one-off

V3 leaned on deed conversions — something a player does once. Gear repair, expeditions and duels recur every single week.

Robust to any one failing

If the marketplace never takes off, thirteen sinks remain. V3's model broke entirely if one assumption was wrong.

THE VOLUME THAT MATTERS

At 100,000 players these fourteen sinks are modelled at roughly **3.2 million tokens of spending per season** — about 32 per player, from an average purchase of well under a dollar a month. Around 2.3 million of that is destroyed. **Illustrative, and every participation rate in it is a guess** until a real city tells us otherwise.

PART 3 · THE SINK ENGINE

Gear you make from where you went

The single best new sink, because it recurs, it rewards exploring, and it never touches anyone's score.

Materials come from terrain, not from grinding

Different kinds of ground yield different materials. Walking a riverside path is not the same as a hill route or a night walk through town. Nothing here rewards *more* distance — it rewards *different* distance, which is exactly the behaviour a health product should encourage.

WHERE YOU WALKED	WHAT YOU FIND	WHAT IT MAKES
Parks and green space	Fibre	Light gear — comfort, longer sessions before wear
Hills and stairs	Grit	Sturdy gear — slower wear, better in bad weather
Waterfront	Salt	Weatherproofing and repair components
Night walks	Glow	Distinctive looks and night-only cosmetics
Somewhere new to you	Spark	The rare one. Needed for the best items — and only earned by going somewhere you have never been.

Gear gives capability, never score

A RULE WE WILL NOT BREAK

No crafted item, no purchase and no subscription may increase Effort or the size of anyone's reward. Gear changes **what you can do**, never **what you are paid**. The moment gear multiplies earnings, the game becomes pay-to-win and the reward pool becomes a shop.

WHAT GEAR CAN DO	WHAT IT CAN NEVER DO
Carry more materials · hold more quest slots · resist weather effects · restore zone condition faster · unlock cosmetic looks · open expedition classes · extend Base Camp capacity	Increase Effort · increase reward share · skip verification · gain territory · improve contest score

Wear and repair — the recurring engine

Gear degrades with use. Repair costs a little, often, and is **20% burn**. This is deliberately the most ordinary transaction in the game: small enough never to sting, frequent enough to matter across a hundred thousand players.

ITEM TIER	CRAFT COST	REPAIRS PER SEASON	SEASON COST
Common	~3 tokens	2	~5
Fine	~9 tokens	3	~15
Signature	~30 tokens	4	~46

Most players never go past Fine. The tier exists so that the small number who want the best have somewhere to spend — which is how every healthy game economy handles its most engaged players.

WHY CRAFTING EARNS ITS PLACE

It rewards **variety** rather than volume, which is better for health and much harder to farm. It gives short walkers a real goal that has nothing to do with distance. And it is the only sink in the list that a player uses almost every week without ever feeling taxed.

Collections, landmarks and rivals

Three systems that cost the economy nothing to run, print no tokens, and give people a reason to care about next week.

Collections — the completionist engine

Badges are earned for the things that already happen: first visit to a zone, a district walked end to end, a season survived as steward, a rare weather event, a landmark reached at dawn. Individually they are trinkets. **Assembled into a set, they become one permanent showpiece** — and minting that showpiece is a 70% burn.

SET	HOW YOU COMPLETE IT	MINT
The District	Visit all seven zones of one district in a season	~12 tokens
The Seasons	Be active in all four seasons of a year	~20 tokens
The Wanderer	First-visit fifty zones you had never entered	~25 tokens
The Founder	Be among the first hundred residents of a new city	~40 tokens
The Long Watch	Hold one charter for four consecutive seasons	~60 tokens

Nothing in a collection affects score, rewards or territory. It is purely a record of what you did — which is precisely why people chase it.

Landmarks — rare, permanent, expensive

A small number of cells in every city are **Landmarks**: the bridge, the park gates, the seafront, the stadium. Once a season, the right to *name* one is auctioned. The winning bid is **burned entirely** — no share to the treasury, no recycling — and the name stands until someone outbids it a year later.

The biggest single burn

A handful of auctions a season, each far larger than any ordinary purchase. Whales get somewhere to spend that harms nobody.

Visible to everyone

Every player passing that cell sees the name. Status is only worth buying when other people can see it.

Confers nothing else

No control, no income, no advantage in any contest. It is a plaque, and that is the entire point.

Rivals — the weekly hook

At the start of each week every active player is matched with a **rival**: someone of similar activity whose routes overlap theirs. For seven days you can see their progress alongside yours. At the end, the higher score takes the week.

ELEMENT	HOW IT WORKS
Matching	Similar recent activity and overlapping ground. Never a mismatch between an athlete and a short walker.
Stakes	Optional. Both may stake tokens; the winner takes the pot less a **30% rake, burned**.
Without staking	Still fully playable. Bragging rights, a streak counter and a season record — no purchase required.
Anti-collusion	Rivals are assigned, never chosen. Repeated pairings are blocked, and staking is capped per week.

WHAT THESE THREE HAVE IN COMMON

None of them prints a token. Collections and landmarks are **pure burn**; rivals redistribute between two players and burn the rake. They add a great deal of reason to play and *nothing at all* to the supply side — which is exactly what an economy under sell pressure needs.

Expeditions and clubs

The social layer, where the largest purchases are made by groups rather than individuals — and where our cheapest player acquisition already lives.

Expeditions — the weekly event

An expedition is a multi-day route challenge with a published goal, an entry fee and a shared prize pot. Crucially, **the prize is the entry fees**. Nothing is minted; the pot is what the entrants put in, less a 30% burn.

TYPE	ENTRY	THE CHALLENGE
Weekly trail	~2 tokens	Cover a published route across several days. Everyone who finishes shares the pot.
District sweep	~5 tokens	Visit all seven zones of a district inside 72 hours.
Club raid	~15/club	A club works together to hit a combined target in a contested district.
Season summit	~25 tokens	The finale. One route, one week, the whole city, a sponsor-funded top-up.

Because entry fees fund the prizes, an expedition can run every week for ever without adding a single token to supply.

Clubs — where thirty people buy one thing

FEATURE	HOW IT WORKS
Club Hall	A shared home with upgrade tiers, paid from a shared treasury. One purchase, thirty contributors, **40% burn**.
Treasury	Members contribute a small automatic share. Every movement is visible to every member.
Club charters	A club may hold up to seven charters citywide, each requiring at least three distinct active members every month.
Crew missions	Weekly goals that need several distinct people. One person cannot complete them alone, by design.
Leaving	Personal items stay yours. Contributions are not refunded — which is what makes joining a real commitment.

Why clubs matter more than any other system

They are the acquisition channel

Running clubs, walking groups and gyms already exist and already meet. One captain brings thirty players — and thirty players in one neighbourhood is instant density.

They are the retention channel

Quitting a game is easy. Letting down people you see every week is not.

They are the biggest sink

Groups buy things individuals never would, because the cost splits thirty ways and the benefit is shared and visible.

GUARDING AGAINST FAKE CLUBS

Club rewards count **distinct verified movers** with sharply diminishing returns per member, and pay out only in locked balance and standing — never in tradable tokens. Thirty accounts on one phone count as one person. A club wins by being active, not by being large.

What actually killed StepN and Axie

The usual explanation is "too much emission". That is wrong, and believing it leads straight into the same trap. The real defect is more specific — and we can design around it.

Their source was fixed to activity. Their sink was elastic to price.

Players kept earning no matter what. They stopped spending the moment confidence wavered.

In both games, tokens were minted per player per day. That number did not care what anything was worth. The sinks — breeding a new creature, minting a new pair of shoes — were *investments*, and people only make investments while they expect the price to hold. So when sentiment turned, spending fell off a cliff while minting carried on exactly as before.

The pattern, period by period — minted versus burned

Illustrative shape of the collapse. Supply grew fastest at precisely the moment confidence was lowest.

The trap underneath: sinks that make more earners

In both games, the main way to spend was to create another earning asset.

Breeding an Axie produced a new Axie that earned. Minting shoes produced new shoes that earned. So the biggest "sink" was really **an investment in more emission**. Every burn today bought more minting tomorrow. That is not a sink at all — it is a subscription to future inflation, and it is why the numbers looked balanced right up until they did not.

How V5 inverts both problems

	STEPN / AXIE	MOVENRUN V5
How much is created	players × a fixed rate	**1.3× the outside money that actually arrived**
When demand falls	Minting continues unchanged	The pool shrinks first, automatically
More players means	Proportionally more tokens	The same pool, divided more ways
The main sink	Creates another earner	Gear, entries, collections — consumed, gone
Emission is	A promise the game must honour	An observation of what already happened

THE SINGLE SENTENCE THAT SEPARATES US FROM THEM

They promised a rate and hoped demand would arrive. We measure the demand that arrived and pay out a fraction of it. Our reward pool cannot outrun confidence, because it is calculated from confidence after the fact.

Auditing our own sinks for the same trap

It would be easy to diagnose someone else's failure and then repeat it. So here is every one of our fourteen sinks, tested against the question that killed them.

Does spending here create a new earner?

If yes, the sink is really an investment in more emission — the Axie breeding trap.

SINK	CREATES AN EARNER?	WHAT ACTUALLY HAPPENS TO THE TOKENS
Gear crafting and repair	No	Consumed. Gear wears out and is never a source of income.
Expedition and raid entry	No	Entry fees become the prize. Zero-sum between entrants, 30% burned.
Collection minting	No	Burned. A collection is a record, and records earn nothing.
Landmark naming	No	Burned in full. A plaque with no rights attached.
Zone modules	No	Capability only. Explicitly cannot enlarge anyone's reward.
Charter insurance	No	Burned. Buys protection, not income.
Club hall, season pass, cosmetics	No	Consumed for access and appearance.
Rival duels	No	Redistribution between two players; the rake is burned.
Heritage mint, marketplace	No	Heritage records carry no yield and no control, by rule.
Charter activation	**Yes — the one**	A new steward becomes eligible for the reward pool.

Why the one exception is safe here and was fatal there

In Axie, breeding *enlarged* emission

Each new creature minted its own tokens on top of everyone else's. Ten thousand new earners meant ten thousand new streams of supply. The sink paid for its own inflation.

Here, a new steward *divides* the pool

The pool is set by outside money, not by headcount. Ten thousand new stewards means the same pool split ten thousand more ways. **Adding earners dilutes; it cannot inflate.**

This is worth stating plainly because it is the load-bearing structural difference between MovenRun and every move-to-earn product that has failed: **in those games the number of earners set the supply; here the money arriving sets the supply, and the number of earners only sets the share.**

THE RULE TO ENFORCE IN CODE, NOT IN A DOCUMENT

No mechanism anywhere in the game may increase the size of the reward pool. Modules, gear, subscriptions, clubs and charters may change a player's *share* of a pool that was already funded — never the pool itself. If a future feature would break that rule, the feature is wrong, not the rule.

PART 5 · NOT REPEATING HISTORY

Keeping money moving

A currency does not fail only from too much supply. It also fails from stillness — tokens sitting in wallets doing nothing, waiting to be sold. Economists call the cure velocity, and every lever below raises it without printing anything.

Velocity = how many times each token gets used in a year

Low velocity means hoarding, and a hoard is just a queue of future sellers.

SPENDING PER SEASON	ON 30M CIRCULATING	READING
1.0M tokens	0.13× a year	Too still — tokens are being held, not used
3.2M tokens	**0.43× a year**	Healthy — our modelled target at 100,000 players
8.0M tokens	1.07× a year	Busy — a mature economy with deep sinks

The five levers, and what each borrows from

LEVER	BORROWED FROM	EFFECT ON CIRCULATION
The locked balance expires after 180 days	Air miles and loyalty points; Gesell's demurrage	A balance that decays gets used. Nothing accumulates into a dead pile.
Gear wears out	Every durable-goods economy	Small, frequent, unavoidable — the most reliable circulation here.
Weekly expeditions and duels	League seasons and match days	A recurring reason to spend, whether or not anyone feels wealthy.
Season pass and collections	Retail deadlines and limited editions	A closing window converts "someday" into "this week".
Charter renewal each season	Leasehold and licence renewal	A predictable cost a steward budgets for rather than resents.

And what we deliberately did not borrow

Staking for yield

Paying people to lock tokens up looks like it reduces selling. It does the opposite over time: it pays holders in more of the same token, so the pile grows while the reasons to spend it do not. We use **utility** to hold tokens, never interest.

Buybacks funded by the company

Promising to spend revenue supporting a price turns an operating business into a market maker for its own token. Sponsors may fund rewards; the company is paid for delivering a service.

How much of a season's rewards can actually reach the market

OF A 4.5M SEASON POOL	TOKENS	SHARE
Spent in-game before it could ever be withdrawn	2.48M	55%
Withdrawable in the first week	0.90M	20%
Released gradually across 180 days	1.12M	25%
Realistic exposure in the first month	**~1.09M**	**24%**

The largest protection is not vesting — it is that **more than half the pool is spent on things players want before it could ever be sold.**

PART 5 · NOT REPEATING HISTORY

What we took from real economies

Almost nothing here is invented. Each mechanism is something countries or long-running games have already tested at scale — which is the main reason to think it will hold.

OUR MECHANISM	WHERE IT COMES FROM	WHAT IT SOLVES
Pool sized by money that arrived	Norway's oil fund — spend only the real return	Rewards can never outrun what the enterprise actually took in
Coverage rule	Currency boards and reserve backing	Every unit issued is matched to something real, not to a forecast
Locked balance that expires	Gesell's demurrage; air miles	Money that must be used cannot become a hoard waiting to be dumped
Stewardship, not freehold	Singapore and Hong Kong leasehold land	Land is allocated to use rather than to whoever bought it first and left
Renewal by care	Licence renewal, tenancy protection	Security for people who show up, without permanent monopoly
Adaptive subdivision	Zoning and planning release	Supply of scarce land expands only where demand is proven
Progressive holding limits	Income tax bands; anti-trust caps	Nobody corners a city, however much capital they bring
Prices in walking days	Index-linked pensions and wages	A shrinking reward pool can never price players out
Entry fees fund prizes	Parimutuel betting; club competitions	Competition can run every week for ever without minting anything
Slow withdrawal	Notice accounts; vesting	Spreads exit without confiscating anything from anyone
Dormancy return	Adverse possession; use-it-or-lose-it licences	Ground nobody uses returns to the map instead of freezing it
Two-state balance	Every successful game economy since the 1990s	Everyday play stays free while something genuinely scarce still exists

THE THREAD THROUGH ALL OF IT

Every mechanism above does one of two jobs: it **keeps value moving**, or it **ties what can be paid out to what actually came in**. The failure mode of a game economy is never too little money — it is money standing still, and promises larger than receipts. Everything in this document is aimed at those two things.

PART 6 · THE SHAPE OF A SEASON

Ninety days with a story

The economy needs a rhythm players can feel. A season should build, peak and settle — not just tick over for three months and pay out.

Spending is heaviest in the last three weeks, when deadlines bite. That is deliberate — and it is when the burn that funds the next pool is earned.

Why the shape matters economically

- **Deadlines create spending.** A collection that closes, a pass that expires and an auction that happens once are worth far more to circulation than the same content available for ever.
- **The burn is concentrated where it can be measured.** The heaviest consumption lands just before settlement, so the next pool is calculated from fresh, observed behaviour.
- **Everyone gets a reset.** Materials, rivals, collections and contests all begin again. Arriving in week one of a season is always a real start, not joining a race already run.
- **Quiet weeks are allowed.** A player who misses the middle of a season can return for the summit. Nothing in the design punishes a fortnight away, which matters for a health product.

Progression in one glance

STAGE	WHAT UNLOCKS	WHAT IT COSTS
Explorer	Base Camp, routes, first quests	Nothing — free for ever
Resident	Local quests, clubs, crafting, collections	Five visits in a fortnight
Contender	Expeditions, duels, contest entry	Locked balance, plus small burns on gear
Steward	Name and style a zone, publish quests, run sponsor campaigns	Contribution, then 20% burn — or a sponsor voucher
Elder	Heritage records, landmark bidding, district coordination	Time, and the deepest burns in the game

The engine under pressure

The test that matters is not whether the good case looks good. It is whether the bad case is survivable — and whether the system shrinks itself before anyone has to intervene.

SCENARIO	PLAYERS	OUTSIDE MONEY	REWARD POOL	BURNED	PER PLAYER
Pilot city	5,000	0.18M	0.24M	0.15M	48
One city working	40,000	1.60M	2.10M	1.45M	53
Base case	100,000	3.45M	4.52M	3.10M	45
Strong growth	400,000	12.0M	15.7M	10.8M	39
Demand shock	100,000	0.90M	1.18M	0.81M	12

Per season. **Illustrative — these test the structure, not adoption.** Outside money is sponsor deposits plus player purchases; the pool is 1.31× it, less the schedule ceiling where that binds.

Read the last row carefully

In the demand shock, spending falls by three quarters. The reward pool falls from 4.5 million to 1.2 million **automatically, in the same season, with nobody deciding anything.** Rewards per player drop from 45 to 12.

That is uncomfortable for earners and it is the entire point. Compare it with the pattern that killed the previous generation, where a collapse in confidence left emission completely untouched and the supply kept growing into a falling market. **Here, the thing that falls first is the payout — not the price.**

The worst case you asked us to model

100,000 PLAYERS, 70% OF THEM HOLDING CHARTERS	TOKENS
Reward pool for the season	4.52M
Spent in-game before it can be withdrawn	− 2.49M
Withdrawable in the first month	1.09M
If 70% of that is actually sold	0.76M reaching the market
Destroyed in the same season	**3.10M**
Destroyed for every token sold	**4.1×**

WHAT THIS DOES AND DOES NOT PROVE

It proves the **structure** holds: the sinks are large enough, spread widely enough, and recurring enough to absorb selling at the hardest setting we could invent. It does **not** prove anyone will buy a jacket, enter an expedition or bid on a landmark. Every participation rate above is our own estimate. **No token design can let most people sell most rewards for ever unless somebody outside the reward loop keeps buying** — and V5's honest answer is that the pool simply shrinks when they stop.

What to build, and what we still do not know

This is a design proposal, not a shipped system. Here is honestly what it requires and where it is guessing.

What has to be built

PIECE	WHERE IT LIVES	NOTES
Locked balance	Backend only	Earning, spending, 180-day expiry. Never on the blockchain, so it costs nothing to run.
Effort curve & caps	Backend	Sits inside the verification service that already works.
Base Camp & Residency	Backend	Off-chain entirely. No fees, no contracts, no collisions.
Gear, crafting, collections, expeditions	Backend, with burns routed on-chain	The largest build, and the largest source of circulation.
Burn router	**New contract**	70% destroyed, 20% to next pool, 10% company. One contract, used by everything.
Coverage controller	**New contract**	Reads verified burn and settled outside money; sets next season's ceiling.
Charter registry	**New contract**	Seasonal terms, renewal, contest settlement, subdivision.
Reward vault	**New contract**	Immediate in-game utility, 20% at day seven, remainder streaming to day 180.

Four new contracts — the same four our own audit already required, since the deployed set has fifteen catalogued defects, two of them critical. **This design does not create the need for new contracts; it decides what they should say.**

What we are guessing

ASSUMPTION	WHY IT MATTERS, AND HOW WE WOULD LEARN
75¢ a month per player	The load-bearing number in the whole model. Learned in the first city within one season.
The 1.31 coefficient	Sets how generous rewards are relative to money arriving. Start conservative; it can only be raised between seasons, slowly.
Gear repair frequency	The most reliable sink if players enjoy it, and dead weight if they resent it. Test wear rates early.
Expedition participation	We assume 40% of players enter something each season. Plausible, unproven.
Landmark auction depth	Assumes a small number of players will bid meaningfully. If nobody does, we lose the biggest single burn.
Charter contest rate	Too few contests and land feels static; too many and stewards feel insecure.
Region rules for withdrawal	Needs legal advice we have not yet paid for. Free play is unaffected either way.

THE HONEST POSITION

The *structure* borrows from mechanisms proven at national and game scale, and it fails safely: when money stops arriving, rewards shrink automatically rather than the supply running away. The *calibration* is entirely ours, and roughly a dozen numbers in it are estimates. The first city exists to replace those estimates with measurements, and we should expect several of them to be wrong.

REFERENCE

The whole thing on one page

Everything you need to explain V5 to somebody else, in the order you would say it.

The ten sentences

1. **Your own space is private and instanced**, so a new player never collides with an existing one, however crowded the street.
2. **Living somewhere is non-exclusive** — everyone who walks a zone can be a resident of it at once.
3. **Only the right to run a zone is scarce** — earned by contribution, renewed automatically while you stay active.
4. **The map splits only where real demand appears**, so land supply follows people, not a schedule.
5. **Walking earns a locked balance** that pays for everything fun and can never be sold.
6. **Anything that creates tradable value carries a real burn** — which is what stops the soft balance hollowing out the token.
7. **The reward pool is about 1.3× the money that actually arrived** from sponsors and players. It is measured, never promised.
8. **Fourteen sinks** — gear, expeditions, collections, landmarks, duels, clubs — give people things worth buying every week.
9. **No mechanism can enlarge the pool** — more players means the same pool divided further, the opposite of what killed Axie and StepN.
10. **When demand falls, rewards fall first** — automatically, in the same season, before the price has to.

The numbers worth memorising

1.3× Reward pool, as a multiple of outside money arriving	**14** Sinks, most of them recurring weekly	**75¢** Spending per player per month the model needs
4.1× Tokens destroyed for every token sold, worst case	**24%** Of a season's pool that can reach the market in month one	**1** Of our 14 sinks that creates a new earner — and it dilutes rather than inflates

The three questions you will be asked

"What happens if someone already owns where I live?"

Nothing — you were never competing. Your space is private, living there is non-exclusive, and only running the zone is scarce. The steward *wants* you there: a busy zone is worth more to hold.

"If free players can buy everything with a locked balance, who needs the token?"

They can buy everything *fun*. Anything that creates something tradable or increases a reward share carries a mandatory burn — so the more the game is played, the more tokens are destroyed.

"Why won't this go the way of StepN?"

Because their supply was set by how many people played and ours is set by how much money arrived. When their players lost confidence, minting carried on regardless. When ours do, the pool shrinks in the same season, automatically.
