

ECONOMY V6 · FINAL DESIGN · CONFIDENTIAL

Everyone earns the token. Playing burns it.

One token, two states. Free players are rewarded for ever and can never sell. Buyers get the rights. And the more people play, the smaller the supply gets.

Prepared for	Version	Replaces	Status
Partner review	6.0 · Final	V2 – V5	Design ready to build

SECTION 1

The decision

Five versions produced good pieces and one bad habit — each rewrote everything. V6 takes the best part of each and stops.

FROM	WHAT WE KEEP	WHAT WE DROP
V2	Locked MOVE for free players — one token, two states, never converts	The Great Burn; the assumption that land prints income
V3	Front-loaded effort curve; prices indexed to earnings	Stride — a second currency that hollowed out token demand
V4	Private base camp; non-exclusive residency; honest burn accounting	Coverage rule that collapses; land expiring every season; too many gates
V5	Many recurring sinks; the reflexivity test	Complexity; fourteen systems nobody could hold in their head

THE SINGLE CHANGE THAT MAKES IT WORK

V3 invented a second currency so free players had something to spend. That was the mistake: it meant free play created no token demand. **V6 pays free players in the real token, permanently locked.** They can spend it on everything in the game, and every token they spend is destroyed — from the same capped supply the buyers hold. Free players stop being a cost and become the engine that shrinks supply.

What each kind of player gets

Free player — locked for ever

- Earns real \$MOVE by moving
- Spends it on gear, land, defence, style
- Can never sell, send or convert it
- No wallet, no purchase, no crypto knowledge
- Plays the whole game, competes, wins

On-chain buyer — the rights layer

- Holds liquid \$MOVE they bought or earned
- **Votes** on parameters and treasury
- **Stakes** for standing and priority
- Owns tradable **deeds** and can sell them
- Trades on the marketplace

Both spend the same token on the same things. The difference is not power inside the game — it is ownership rights outside it. A free player is never beaten by a wallet; they are only ever beaten by someone who moved more.

Why this burns more than it prints

This is the mechanism the whole design rests on. It is worth understanding precisely, because it is what no previous run-to-earn game had.

Locked tokens can only be spent inside the game.
Everything spent inside the game is destroyed.
So every locked token ever minted eventually leaves the supply for good.

Of six million tokens released, nearly five million are destroyed and one million can ever reach a market.

The property that makes growth safe

SHARE OF PLAYERS WHO ARE FREE	DESTROYED	CAN BE SOLD	BURNED PER TOKEN SOLD
60%	4.36M	1.32M	3.3×
70%	4.77M	0.99M	4.8×
80%	5.18M	0.66M	7.8×

READ THAT TABLE AGAIN

The more free players there are, the more deflationary the economy becomes. In every previous run-to-earn game, growth meant more tokens hitting the market and was the thing that eventually killed them. Here, growth means more tokens locked into a form that can only be burned. **Mass adoption is now the safest thing that can happen to us, not the most dangerous.**

SECTION 3

How you earn it

Consistency, not distance. The first kilometre pays fully; the tenth barely pays at all.

A marathon earns 4.7× a 750-metre walk, for 56× the distance. Short walkers are real players; distance farming does not work.

SESSION	COUNTS AT	PLUS
First 1 km	100%	
1 – 3 km	60%	+0.5 Effort for your first session of the day — showing up beats going far.
3 – 6 km	30%	
6 – 10 km	10%	
Beyond 10 km	0%	Capped at 4.0 Effort per person per day, so no one can grind past the ceiling.

What that pays

PLAYER	EFFORT / MONTH	\$MOVE / SEASON
Short walker — 750 m, 5 days a week	27	~36
Casual — 2 km, 5 days a week	46	~60
Regular — 4 km, 6 days a week	78	~103
Dedicated — 8 km, 7 days a week	115	~152

The most committed athlete earns just over four times the most casual walker. That is deliberate: this is a health product, not a race.

Six ways to spend it

The burn engine. Every one recurs, every one is something players want, and every token spent is destroyed.

1 · Gear

Craft boots, jackets and packs from materials found in different terrain. Parks give one thing, hills another, night walks another. Looks and capability — never extra earnings.

2 · Recharge

Gear and land hold a charge that drains as you use them. Walking through your own land recharges it free; paying recharges it instantly. The most frequent spend in the game.

3 · Upgrade

Land levels up. Each level costs more and does more — more quest slots, stronger defence, more style options. Never more income.

4 · Defend

When a rival challenges your land you can fortify it, up to three times. Costly, temporary, and the difference between holding and losing.

5 · Protect

Insure land before a contest and recover part of your outlay if you lose. Removes the fear that stops people competing at all.

6 · Style

Colours, map themes, banners, titles, share cards. Pure sink, no advantage, and the easiest thing in the world to sell to someone enjoying themselves.

What it costs, and what it burns

SPEND	COST	WHO DOES IT	PER PLAYER / SEASON	WHY THAT PRICE
Gear crafting	14	55%	7.7	An impulse, not a decision
Recharge	22	80%	17.6	Small and frequent — free if you visit
Land upgrade	55	35%	19.2	A real goal worth saving for
Defend	38	30%	11.4	Painful enough to matter, affordable enough to try
Protect	20	25%	5.0	Cheap insurance encourages more contests
Style	15	40%	6.0	Guilt-free, repeatable, pure burn
Total			67	against ~60 earned

THE CALIBRATION THAT MATTERS

A typical player earns about **60** tokens a season and finds about **67** worth of things they want. The gap of seven is bought — roughly **20 cents a month** at a realistic token price. Small enough that nobody feels pushed, large enough that across a city it is the demand that absorbs everything the sellers sell.

Supply that can never run away

This is where StepN and Axie died. Their supply grew with their player count. Ours cannot.

Falls fast while the network is small, then settles at a level the reserve funds for over forty years.

RULE	SETTING
Hard cap, unchangeable in the contract	1,000,000,000 \$MOVE
Reserved for player rewards	300M (30%)
Released per season	Starts at 6M, falls 10% a season, floors at 1.5M
How long the reserve lasts	About 43 years
Does the pool grow with players?	No — never. More players share the same pool
Can anyone raise it?	Only a timelocked governance vote, within published limits

Why this is the whole difference

	STEPN / AXIE	MOVENRUN
Supply set by	Number of players × a rate	A fixed schedule
Twice the players	Twice the tokens minted	The same tokens, half each
Main sink	Breeding or minting — <i>created another earner</i>	Gear, recharge, defence — consumed and gone
When confidence fell	Spending stopped, minting continued	Locked tokens keep burning regardless of price

THE TRAP THEY FELL INTO, NAMED PLAINLY

In Axie, breeding a creature was the biggest way to spend — and it produced a new creature that minted its own tokens. The main sink was really **an investment in more inflation**. Nothing in our six sinks creates a new earner. Gear wears out, charge drains, fortifications expire, insurance pays out and ends. Everything is consumed.

SECTION 6

What buying actually gets you

Free players get the whole game. Buyers get ownership rights. Keeping those two things separate is what makes this fair and what keeps it Web3.

	FREE PLAYER	ON-CHAIN HOLDER
Earn \$MOVE by moving	Yes	Yes
Spend it on all six sinks	Yes	Yes
Capture, upgrade and defend land	Yes	Yes
Clubs, contests, leaderboards, seasons	Yes	Yes
Win a city war	Yes	Yes
Sell or transfer tokens	Never	Yes
Vote on governance	No	Yes
Stake for standing and priority	No	Yes
Own a tradable deed	No	Yes
Trade on the marketplace	No	Yes

The three rights, and what each is for

Voting

Holders vote on emission settings, sink prices, season rules and treasury spending. Snapshot-based, timelocked, published in advance.

The economy belongs to the people holding it, not to us.

Staking

Lock tokens for a season to gain standing, priority in land contests, and a larger voting weight. **It pays no interest** — it buys position, not yield. That is deliberate: interest just makes piles bigger.

Deeds

Land held long enough can be minted as a tradable deed with its full history. Sellable, rentable, sponsorable — the one genuinely scarce asset in the game.

The bridge between the two

A free player who wants the rights layer has a route: hold land for sixty days, then mint it as a deed. That mint has a token cost, payable in cash or in tokens bought on the market. **Nothing about being free is permanent except the locked state of tokens already earned** — and those stay locked for ever, which is exactly what stops farm-and-dump.

WHY THIS FEELS LIKE WEB3 RATHER THAN A COMPANY ACCOUNT

Every deed, every vote and every stake is on Base, under the holder's own keys. We cannot revoke a deed, reverse a vote or freeze a stake. What we control is the game; what the holders control is the economy's settings and their own property. **A free player is never controlled by us either — they simply hold a balance that was minted non-transferable and always will be.**

Land, and nobody locked out

Two people can live on the same street. Only one can run the zone. Separating those two ideas removes the collision entirely.

LAYER	HOW MANY	WHAT IT IS
Home	One each, free	Your own base. Private, never shown to anyone, cannot be taken. A hundred players in one street each have one.
Residency	Unlimited	Local membership, earned by five visits in a fortnight. Everyone who walks there can hold it at once. It blocks nobody.
Charter	One per zone	The right to run the zone — name it, style it, set quests, host sponsors. Earned by contribution, renewed automatically while you stay active.

THE INCENTIVE THAT MAKES IT PLEASANT

A charter holder's standing rises with how busy their zone is. **So they want newcomers there.** A new player is not a threat to be resented — they are what makes the zone worth holding. That is the opposite of every virtual land project so far.

Zones start large. When one reaches around forty regular residents it splits into seven at the next season boundary; the holder keeps one, six open up. Land supply follows people, never a schedule.

What we borrowed, and from where

MECHANISM	TAKEN FROM	WHAT IT FIXES
Charge that drains and refills	Interval and fitness apps	A daily reason to return; a recurring spend that never feels like a tax
Cost and capability rising together	Clash of Clans upgrades	The grind never lengthens, so nobody hits a wall and quits
Gear that wears out	Every durable-goods economy	Small, frequent, unavoidable circulation
Seasons and a reset	League sport	Arriving late is always a real start
Locked rewards	Loyalty points and air miles	Real reward, zero sell pressure
Prices set in walking days	Index-linked pensions	A shrinking pool can never price players out
Leasehold, not freehold	Singapore land policy	Land goes to people who use it
Snapshot voting with a timelock	Standard on-chain governance	Nobody can buy a vote at the last minute

Where this lives in the app we already have

Almost every screen this economy needs is already built. The work is wiring, not invention.

ALREADY IN THE APP	ECONOMIC ROLE	WHAT HAS TO BE ADDED
territory, zones, zoneCommand	Capture, upgrade, defend	Real hexagon capture and the upgrade ladder
lockedMove	Locked balance	Make it a real ledger instead of a display preview
deedPreview, deedsView	Deeds and rights	Connect to the on-chain deed contract
clubs, clubTerritory, crewMissions	Group sinks	Shared treasury and club spending
cityDistricts, cityWarBoard, districtMastery	Contests	Scoring, entry fees, settlement
collectionsView, zoneCollections	Status sinks	Minting a completed set
rivalGhosts	Weekly hook	Matching and optional stakes
seasonObjectives, weeklyRecap	Season rhythm	Season pass and settlement
sponsorZones, eventZones	Outside money	Real campaigns and dashboards
routeProof, routeTrust, signalQuality	Anti-cheat	Wire to the verification service that already runs
territoryAlerts	Defence prompts	Notify when land is challenged
wallets, security	Rights layer	Switch on a wallet provider

WHAT THIS MEANS FOR COST AND RISK

Eleven of the twelve systems this economy needs already exist as working screens with tested logic. **The economy is not a rewrite — it is a ledger, four contracts, and connecting what is already there.** That is the single strongest argument that this design is buildable rather than aspirational.

The four contracts

CONTRACT	JOB
Token with two states	Mint locked or liquid from one capped supply; locked can never transfer
Burn router	Every sink pays through it; destroys tokens and publishes the receipt
Season controller	Releases the fixed pool, splits locked and liquid, settles the season
Deeds and governance	Tradable land, snapshot voting, staking, timelock

These replace the deployed test contracts, which our own audit already found to carry fifteen defects, two of them critical. The redeploy was necessary regardless; this design decides what the new contracts should say.

The numbers, and where they break

All figures are illustrative models of the structure — not forecasts. There are no players and no revenue yet.

SCENARIO	PLAYERS	RELEASED	DESTROYED	CAN BE SOLD	BURN : SELL
Pilot city	5,000	6.0M	4.8M	0.99M	4.8×
Base case	100,000	6.0M	4.8M	0.99M	4.8×
Growth	500,000	6.0M	5.2M	0.66M	7.8×
Demand shock	100,000	6.0M	4.4M	1.32M	3.3×

Notice the released column never changes. That is the point — the pool is fixed by schedule, not by how many people show up.

Reading the shock case

In a downturn, players stop buying deeds, so the free share falls and more of the pool is minted liquid. Burn falls, selling rises, and the ratio drops from 4.8× to 3.3×. **It gets worse — and it stays positive.** More is still destroyed than sold, because locked tokens keep burning whatever the price does. That is the property no previous run-to-earn game had: **our burn does not depend on confidence.**

What would actually break this

RISK	WHAT HAPPENS, AND WHAT WE WOULD DO
Players do not spend	The biggest risk by far. If people hoard locked tokens instead of spending them, burn stalls. Mitigated by charge draining, gear wearing out and seasonal deadlines — but it needs proving with real players.
Nobody buys the top-up	The seven-token gap goes unfilled and sinks shrink. Survivable — the economy just runs smaller — but it removes the demand that absorbs selling.
Too few deed holders	Fewer people to sell, which is fine, but also fewer buying deeds and voting. Governance stays thin.
Sinks feel like a tax	If recharge is resented rather than enjoyed, players stop rather than pay. Wear rates must be tuned generously and tested early.
Locked balance grows unspent	Add an expiry — unspent locked tokens lapse after 180 days and are destroyed. Only introduce this if hoarding actually appears.

THE HONEST SUMMARY

The structure is sound and fails safely: supply is capped, the pool never grows with the player base, no sink creates a new earner, and the majority of every season's release can only ever be burned. **The calibration is entirely ours.** Roughly eight numbers here — participation rates, costs, the free/paid split — are estimates. The first city replaces them with measurements, and several will be wrong.

The whole thing, once

Eight sentences

1. **Everyone earns the real token by moving** — the first kilometre counts most, so a short daily walk is a genuine way to play.
2. **Free players' tokens are locked for ever:** fully spendable inside the game, never sellable, never convertible.
3. **Buyers get the rights** — voting, staking, tradable deeds and the marketplace — but no advantage inside the game.
4. **Six things to spend on:** gear, recharge, upgrade, defend, protect, style. All recurring, all consumed.
5. **Everything spent is destroyed**, so most of every season's release leaves the supply for good.
6. **The pool is a fixed schedule** from a capped supply — twice the players never means twice the tokens.
7. **The more free players there are, the more deflationary it gets**, which is the exact reverse of what killed StepN and Axie.
8. **No sink creates a new earner** — gear wears out, charge drains, fortifications expire. Nothing buys more inflation.

4.8×

Tokens destroyed for every token that can be sold

1B

Hard cap. The pool never grows with the player base

43 yrs

How long the reward reserve funds seasons

20¢

Monthly top-up a typical player might choose to buy

0

Sinks that create a new earner

11 / 12

Systems this needs that already exist in the app

The three questions you will be asked

"If free players can't sell, is the reward real?"

Completely. It buys everything in the game — gear, land, upgrades, defence, style. What it cannot do is leave. That is what protects the token for the people who did buy in, and it is stated plainly at signup.

"Why won't this end like StepN?"

Their supply grew with their player count and their main sink created new earners. Ours is a fixed schedule, and nothing you can buy makes more tokens. When their players lost confidence, minting carried on; when ours do, locked tokens keep burning anyway.

"What stops someone farming free accounts?"

Free accounts earn only locked tokens, which have no market value and never convert. There is nothing to farm. Selling requires a deed, which requires holding real land in a real place for sixty days.

MovenRun Economy V6 · Final design. Confidential, prepared for partner review. Replaces versions 2 to 5. This is a design proposal requiring four new contracts, not a shipped system. All figures are illustrative models of structure, not forecasts — there are no players, no revenue and no validated pricing. \$MOVE does not trade anywhere; there has been no sale, listing or allocation. Deeds are game assets, not property, and carry no income right. Nothing here is financial advice, an offer, or a promise of returns.
