

PARTNER ONBOARDING BRIEF · CONFIDENTIAL

Move. Capture. Own.

Everything you need to understand MovenRun — the product, the technology, the business, and the plan — written for someone who has never touched crypto.

Prepared for	Version	Built on	Stage
Incoming partner onboarding	1.0 · August 2026	Base (Ethereum Layer 2)	Development · Testnet deployed

How to read this document

You do not need any technical or crypto background to read this. Every specialist term is explained the first time it appears, and there is a plain-English glossary at the end.

Sections 1–4

The product. What MovenRun is, why it exists, and what using it feels like. Read these even if you read nothing else.

Sections 5–9

The technology, taught from zero. What crypto is, what Base is, and what they actually do inside our app.

Sections 10–16

The business. What is already built, the roadmap, how we get users, why us, and the honest risks.

Contents

01	MovenRun in one page	The whole product, summarised
02	The problem we are solving	Why movement apps and "move-to-earn" both failed
03	The core loop: Move → Capture → Own → Grow	The four verbs the entire game runs on
04	What using the app actually feels like	A walkthrough of a real session, screen by screen
05	Crypto, explained from zero	Blockchain, wallets, tokens and NFTs in everyday language
06	What is Base, and why we chose it	The chain we build on and what it costs us
07	How MovenRun is built: three layers	App → verification → blockchain
08	Two users, two experiences	The non-crypto user and the crypto user, side by side
09	Zone Deeds and the \$MOVE economy	What we own, what we earn, and how the money works
10	Proof of movement: how we stop cheating	The single most important technical problem
11	What is already built	Evidence, not promises — with an honest status table
12	Roadmap	Four phases and what unlocks each one
13	How we get users	The growth playbook, city by city
14	Why us, why now	The case for this team and this moment
15	Risks, stated honestly	What could go wrong and what we do about it
16	Glossary & your first two weeks	Every term in one line, plus an onboarding checklist

ONE THING TO HOLD ON TO

If you remember a single sentence from this document, make it this one: **MovenRun turns the ground you walk on into property you actually own — and the person walking never has to know a blockchain was involved.**

MovenRun in one page

If you had ninety seconds to explain MovenRun to a stranger, this is what you would say.

The plain version

MovenRun is a mobile game you play by walking, running, or cycling in the real world. We divide the entire planet into small hexagon-shaped tiles — think of a honeycomb laid over a map. When you move through a tile, you capture it. Hold a tile and it becomes yours: a piece of digital property called a **Zone Deed** that is recorded permanently and independently of our company, so nobody — including us — can take it away. Capture enough neighbouring tiles and you own a district. Team up with a club and you fight for a city.

The four things that make it different

1 • You own progress, you don't rent it

In a fitness app your streak is a number in someone's database. If the company shuts down, it is gone. In MovenRun your territory is recorded on a public ledger under your own keys. It survives us.

2 • Every claim is proven

Territory is only valuable if it is hard to get. Every session is checked for physical plausibility — realistic speed, sane GPS accuracy, continuous motion — before it can claim anything. Faking movement is rejected.

3 • The crypto is invisible

No seed phrases, no wallet setup, no buying a coin before you can start. You tap once and you are moving. The blockchain is doing real work underneath, and a normal user never sees a single piece of it.

4 • The economy is built to last

Previous "move-to-earn" apps printed tokens with nothing to spend them on and collapsed. We designed the ways money leaves the system *before* the ways it enters. That order is deliberate.

Where we are right now

8

Smart contracts written, tested, and deployed to Base test network

26/26

Contract tests passing, including a full end-to-end integration test

0.74 km²

The size of one capturable zone — roughly a small neighbourhood

4

Roadmap phases, each gated on evidence rather than a calendar date

1B

Maximum \$MOVE tokens that can ever exist — a hard cap in code

3

Ways to play: walking, running, and cycling — all equally valid

The honest status line

READ THIS BEFORE YOU TALK TO ANYONE EXTERNAL

MovenRun is a **development-stage product**. The blockchain foundation is genuinely built and live on Base's *test* network. The mobile app today is a working shell that proves the build pipeline and on-device progress system, and the full territory map is the next thing we ship. Our public documentation describes the protocol **as designed**. When you speak about MovenRun, describe the vision as the vision and the built parts as built — Section 11 gives you the exact line-by-line status so you never have to guess.

The problem we are solving

Billions of people move every single day. Almost none of that movement builds anything for the person doing it. Three previous attempts got close and each failed in a specific, fixable way.

Failure one — fitness apps forget you

Strava, Google Fit, Apple Fitness and the rest are excellent at *measuring*. You walk five kilometres, they show you a number, and tomorrow that number is history. Nothing accumulates into something you hold. Your three-year streak is a graph, not an asset. And crucially, the moment you stop paying or the company changes direction, all of it is theirs to switch off.

Failure two — location platforms sell you

The other major use of movement data is advertising. Platforms collect where you go, build a profile, and sell access to it. The mover generates all the value and captures none of it. This is the model MovenRun most deliberately rejects: we are not a data broker, we do not sell location profiles, and our verification system is designed to keep *proofs* of movement rather than permanent trails of where you have been.

Failure three — the first "move-to-earn" wave collapsed

In 2022 a category of apps promised to pay you in cryptocurrency for walking. They grew explosively and then unravelled. The reason is simple and worth understanding properly, because avoiding it is the core of our economic design:

The difference in one picture: the old model gave people a token and no reason to keep it. Ours makes the token the thing you spend to defend what you own.

The insight underneath all three

Ownership is the most durable form of progress. A score resets. A streak breaks. A token price falls. But property you hold, that you have defended, that has a history attached to it and neighbours you fought for — that keeps meaning something regardless of what any market does. So we made the map itself the asset, and made every claim on it require proof of real effort.

The core loop: Move → Capture → Own → Grow

Every feature we build has to serve these four verbs. If a proposed feature does not advance one of them, it is out of scope. This is our single most important internal rule.

The MovenRun core loop. It is closed on purpose: growth gives you a reason to move again tomorrow.

Move

You open the app and start a session. Walking, running, and cycling are treated as equally valid — no minimum speed, no mode that scores "better". A twenty-minute walk around your block is a first-class move here. That is a deliberate decision, not a compromise: a network that only rewards athletes never changes how ordinary people actually live.

Capture

Your route crosses hexagonal tiles on a global map, and finishing the session claims them. This is the moment a walk stops being exercise and becomes a foothold — the tiles light up along the line you actually walked.

Own

Captured zones become **Zone Deeds**: records of ownership held under your own keys rather than in our database. A deed is yours to keep, strengthen, defend when challenged, and transfer. This is the difference between MovenRun and every scoreboard ever built — the map remembers you because you genuinely own part of it.

Grow

Ownership compounds. Zones group into **districts**; districts build club and city standing; actively-held territory earns in-game yield; and holding a stake gives you a vote in how the network runs. A year of morning walks becomes a portfolio of territory and a real voice in the game's direction.

The same loop at three speeds

MODE	A TYPICAL SESSION	HOW OWNERSHIP GROWS
Walking	20–40 min neighbourhood loop	Deep, durable ownership of home territory. Strongest streaks and district mastery — the most defensible position in the game.
Running	3–8 km route	Wider reach per session. Ideal for reclaiming contested zones and pushing into new districts.
Cycling	10–25 km ride	Broad exploration, touching many zones. Returning is what turns exploration into holdings.

WHY THIS MATTERS COMMERCIALY

Consistency beats intensity in our scoring. That is a health-first choice, and it is also the right retention design: the player who walks twenty minutes a day for a year is worth vastly more to the network than the athlete who runs a marathon once and disappears.

What using the app actually feels like

A walkthrough of one real session, from the moment someone downloads the app to the moment they own a piece of their neighbourhood. No jargon in this section at all.

One complete session, start to finish. Notice what is absent from every screen: any mention of a blockchain, a wallet, or a token.

Step by step, in words

- 1. You download the app and tap once.** An account is created for you, and behind the scenes so is a secure wallet — but you are never shown a seed phrase or asked to install anything. You are moving within seconds.
- 2. You pick a mode and press start.** Walk, run, or cycle. The map shows the hexagons around you: grey means unclaimed, green means you already hold it.
- 3. You go for your walk.** The route draws itself live. Distance, time, and pace are shown large and simple, so your attention stays on the pavement rather than the screen. You can pause and resume freely — nothing punishes stopping.
- 4. You finish and get a summary.** Distance, active time, zones explored, XP earned, streak maintained. Then the satisfying part: the hexagons you crossed animate into your colour. Six new zones are yours.
- 5. Over the following weeks it compounds.** You return to the same routes and your hold strengthens. Neighbouring zones connect into a district. You join a club and your captures start counting toward a shared total. Somebody challenges one of your zones and you have to go out and defend it.

THE DESIGN PRINCIPLE BEHIND ALL OF IT

Nothing in the live session requires interaction, no mechanic rewards speed over safety, and no information depends on animation or colour alone. It is designed to be usable by someone with reduced mobility, poor eyesight, or an old phone — because that is most of the world.

Crypto, explained from zero

You do not need to like crypto, invest in it, or find it interesting to be excellent at this job. You do need to be able to explain five ideas clearly. Here they are, each with an everyday analogy.

1 · A blockchain is a shared record book that nobody owns

Imagine a ledger in the middle of a village square. Anyone can write in it, everyone can read it, and once something is written it cannot be erased or edited — you can only add a new line. Thousands of independent people keep identical copies, so if one person tries to cheat their copy, every other copy disagrees and the cheat is rejected.

That is a blockchain. It is not a currency, a company, or a website. It is a way of keeping a record that no single party controls. Everything else in crypto is built on top of that one property.

Why we care

Because a record nobody owns is a record we cannot revoke. When we say a player genuinely owns their territory, this is the mechanism that makes it true rather than a marketing line. If MovenRun the company disappeared tomorrow, the deeds would still exist and still belong to the people who earned them.

2 · A wallet is a key, not a bank account

The word "wallet" is a poor name and causes most of the confusion. A crypto wallet does not *hold* anything. It holds a **private key** — a very long secret number that proves you are you. The ledger says "this territory belongs to key #4821..."; whoever can produce that key controls that territory.

Traditionally, users are made to write down twelve random words (a "seed phrase") that can regenerate their key, and told that if they lose those words their assets are gone forever. This single step is where the overwhelming majority of normal people abandon crypto apps — and rightly so.

What we do instead: embedded wallets

MovenRun creates the wallet for the player automatically at sign-up and secures it for them, the same way an email provider secures their inbox. There is no seed phrase to write down and nothing to install. The ownership is completely real and completely theirs — it just does not get in the way. A player who later becomes crypto-savvy can export that wallet and take full control at any time. **This is the single most important product decision in MovenRun.**

3 · A token is a unit that the ledger counts

If the shared record book can track who owns what, it can track quantities too. A token is simply a countable balance recorded on that ledger. Our token is called **\$MOVE**. Inside MovenRun it works like the currency of the game: you earn it by moving, and you spend it to claim premium zones, enter challenges, and strengthen what you hold.

The important distinction: some tokens are designed as investments, and some are designed as fuel for a system. \$MOVE is designed as fuel. Section 9 covers this honestly, including the parts we deliberately constrain.

4 · An NFT is a deed, not a picture

NFT stands for "non-fungible token", which is a terrible name for a simple idea. Fungible means interchangeable — any ten-rupee note is as good as any other. Non-fungible means each one is distinct and identifiable, like the title deed to a specific house.

NFTs became famous through cartoon profile pictures, and that association is unhelpful. The underlying technology is just a way of recording *"this specific unique thing belongs to this specific person"* on a ledger nobody controls. Land registries, ticketing, and certificates are the natural uses.

Ours is called a Zone Deed

Each hexagon on our world map has a permanent unique identifier. A Zone Deed is an NFT whose identifier *is* that hexagon. So the deed is not a picture of a place — the deed *is* the place, as far as the game is concerned. It carries who holds it, the history of how it changed hands, how strongly it is defended, and the yield it has earned.

5 · Gas is the postage stamp, and we pay it

Writing to a public ledger costs a small fee, called **gas**, which pays the network of computers that maintain it. Normally the user must hold some cryptocurrency to pay it — meaning a new player would have to buy a coin before they could claim their first zone. That is an absurd barrier for a walking app.

We use a technology called **account abstraction** to sponsor those fees on the player's behalf. The player presses "claim" and it just works. We absorb a tiny cost per transaction; on Base that cost is a fraction of a cent, which is precisely why we chose Base.

HOW TO TALK ABOUT THIS EXTERNALLY

Some people have strong negative associations with crypto, often for good reasons — scams, speculation, and collapsed schemes. Do not argue with that. The honest and disarming answer is: *"You're right that a lot of it has been rubbish. We use the technology for one narrow thing — making sure the territory you earn actually belongs to you and can't be taken away. You never have to buy anything, and you'll never see a wallet."* That sentence converts sceptics better than any amount of enthusiasm.

What is Base, and why we chose it

Base is the specific blockchain MovenRun is built on. Understanding what it is — and why it is the right choice — matters, because we are applying to its accelerator programme.

The problem Base exists to solve

Ethereum is the largest and most trusted programmable blockchain, but it has a well-known weakness: it processes a limited number of transactions at a time, so when it gets busy, fees rise. At peak, one simple action could cost several dollars. For a banking application that might be acceptable. For a game where someone claims six hexagons after a morning walk, it is unworkable.

What a Layer 2 does

A "Layer 2" is a faster, cheaper network that sits on top of Ethereum and periodically writes a compressed summary of its activity back down to it. You keep Ethereum's security guarantees, but transactions are fast and cost a tiny fraction of a cent.

Why the stack matters: our users get speed and zero fees; our ownership records inherit Ethereum's security.

Why Base specifically

REASON	WHAT IT MEANS FOR MOVENRUN
Costs are negligible	Our economics depend on sponsoring every user's fees. Thousands of daily captures are only viable at a fraction of a cent each. On Ethereum directly, this product could not exist.
Confirmation is fast	Roughly two seconds. A capture has to feel instant at the end of a run, not like waiting for a bank transfer.
Best-in-class invisible onboarding	Base has the strongest ecosystem for embedded wallets and sponsored gas — the two things that let us hide crypto from the player. The deciding factor.
Built by Coinbase	Base is operated by a large, regulated, publicly-listed company. For a product that must be trusted by non-crypto users, that backing is a genuine asset.
Consumer-app focus	Base has positioned itself as the chain for mainstream consumer apps rather than financial trading. Our product is exactly what its ecosystem wants to attract — which is why we fit Base Batches.
Distribution	A flagship consumer app on Base gets access to an ecosystem actively looking for apps to promote. See Section 13.

WHERE WE ALREADY ARE ON BASE

This is not aspirational. Our full contract suite — eight contracts covering the token, the deeds, the challenge system, seasons, the vault and governance — is **already written, tested, and deployed to Base Sepolia**, Base's public test network. Test networks are functionally identical to the real thing but use valueless tokens, so you can prove a system works before real money touches it. Deploying to Base mainnet is a Phase 3 decision, deliberately gated (see Sections 11 and 12).

How MovenRun is built: three layers

The whole system is three layers stacked on each other. If you understand this diagram you understand our architecture, and you can hold your own in any technical conversation about us.

Movement flows up; ownership settles down. The chain never takes movement on faith — it acts only on verified proofs.

Why hexagons, and not squares

We use an open standard called **H3** — originally built by Uber — which tiles the entire planet into hexagons. Every point on Earth belongs to exactly one hexagon with a permanent identifier, so two players standing on the same corner are always in the same zone, anywhere in the world. We use size level 8: about **0.74 km²** per tile, roughly a small neighbourhood — big enough to feel meaningful, small enough that a single walk captures several.

Even neighbours

Every hexagon touches six others at an equal distance. With squares, diagonal neighbours are further away than edge neighbours, which makes rules about spreading and defending territory messy and unfair.

Fits how people move

Real routes curve. Hexagons approximate the area around a curving path far more naturally than a square grid does.

Nests cleanly

Small hexes roll up into bigger ones, which is exactly how zones become districts and districts become cities — one grid for the whole game.

What the eight contracts do

A "smart contract" is a program that lives on the blockchain. It runs exactly as written, the same way for everyone, and nobody — including us — can quietly change it. Our suite, in plain terms:

CONTRACT	IN PLAIN LANGUAGE
MoveToken	The \$MOVE currency itself. Enforces the one-billion supply cap and only creates new tokens when the verification layer has signed off on a real route.
GPSOracle	The bridge between the real world and the chain — the only thing the token contract trusts when deciding whether someone actually moved.
ZoneNFT	The Zone Deed — our land registry. One entry per hexagon: the owner, the yield earned, and how long it has been held.
ZoneChallenge	Land defence. Challenging a zone opens a fourteen-day contest decided by who moves more there.
GearNFT	Collectible gear — shoes, jacket, watch, headband — boosting what a session earns, up to a hard cap.
SeasonController	Runs the ninety-day season cycle: start, wind-down, and settlement.
MoveVault	Staking and the community treasury — where players lock tokens and funds are held.
MovenDAO	Governance — how the community votes on network settings, treasury and direction.

Two users, two experiences

MovenRun has to work for someone who has never heard of a blockchain *and* for someone who has been trading on-chain for years. These are not two products — they are the same product with different amounts of the machinery exposed.

Priya — has never used crypto

Walks 25 minutes most mornings. Downloaded the app because a friend in her club shared a city challenge.

- 1 Taps "Start". An account and a secure wallet are created invisibly.
- 2 Walks. Watches hexes light up. Gets a summary and a streak.
- 3 Claims her zones with one button. Fees are paid for her; she never notices.
- 4 Joins a club, competes for her district, defends her zones by walking.

She owns real on-chain assets and has never seen the word "blockchain" in the app.

Arjun — crypto-native

Holds NFTs, uses a hardware wallet, reads the contracts before he touches anything.

- 1 Connects his own wallet instead of using the embedded one. Full self-custody.
- 2 Verifies his deeds on a public block explorer, independently of our app.
- 3 Trades deeds, stakes \$MOVE, targets high-traffic zones strategically.
- 4 Votes on governance proposals about the network's parameters.

He gets a real asset layer under a game he actually enjoys playing.

The same map, the same deeds, the same economy. The only difference is how much of the machinery each person chooses to see.

What each user sees and does not see

ASPECT	NON-CRYPTO USER	CRYPTO-NATIVE USER
Sign-up	One tap. A wallet is created and secured for them in the background.	Connects an existing wallet, or exports the embedded one to self-custody.
Seed phrase	Never shown one. Never needs one.	Full key control available whenever they want it.
Fees	Sponsored. They never buy or hold a gas token.	Can transact directly and pay their own if they prefer.
Language in the app	"Zones", "territory", "claim", "defend". Game words.	Can see the underlying contract addresses and token IDs.
What they own	Genuine on-chain deeds — identical to what Arjun holds.	Genuine on-chain deeds — identical to what Priya holds.
What motivates them	Health, habit, streaks, their neighbourhood, their club.	Ownership, scarcity, strategy, governance, composability.
Exit path	Can walk away and their deeds still exist, still theirs.	Can withdraw everything to a wallet we do not control.

WHY THIS DUAL DESIGN IS THE WHOLE STRATEGY

Almost every on-chain consumer product picks one audience and loses the other. Crypto-first apps have real ownership but an audience of a few million enthusiasts. Mainstream apps have huge audiences but no real ownership to offer. MovenRun's bet is that you can build for Priya and Arjun in the same product — **because Priya is where the volume is and Arjun is where the depth is, and the map only becomes interesting when both are on it.**

Zone Deeds and the \$MOVE economy

This is the section people will question you on hardest, so it is worth reading twice. The short version: movement creates the token, playing the game consumes it, and territory is the asset that sits above both.

The economic loop

The rule we designed around: sinks and caps are decided **BEFORE** incentives

Scarcer supply makes held territory more valuable — which makes moving worth more

The loop the previous generation of move-to-earn apps did not have. Their tokens only ever entered.

The numbers, as currently designed

These are the parameters written into our deployed test contracts. They are subject to change through governance and further testing before any mainnet launch, and none of them is a promise of value.

PARAMETER	VALUE
Token name	MoveToken (\$MOVE)
Maximum supply, ever	1,000,000,000 \$MOVE — a hard cap enforced in code
How new tokens are created	Only against a signed proof of a verified route
Starting rate	10 \$MOVE per kilometre
Halving	The rate halves roughly every six months, so issuance decays over time
Daily cap per account	200 \$MOVE at launch, halving with each epoch — anti-farming
Zone tax	2% of everything minted in a hexagon is credited to that zone's deed holder
Loyalty bonus	Yield multiplier rises with holding time: 1.0× → 1.25× → 1.5× → 1.75× at 30 / 90 / 180 days
Dormancy	A zone untouched for 180 days can be flagged; after 210 it can be reclaimed and reopened
Season length	90 days, ending with a partial burn of top-zone yield

Where tokens are permanently destroyed

ACTION	AMOUNT BURNED
Minting a Zone Deed	Scales with how busy the zone is — popular land costs more
Declaring a challenge on someone's zone	100 \$MOVE
Stronghold boost while defending	300 \$MOVE per activation, max 3
Extending a challenge window	500 \$MOVE
Great Burn at season end	10% of accumulated yield, top 100 zones

Intended supply distribution

Sixty percent goes to the people who actually move. Team allocation carries a 12-month cliff and 36-month linear vesting.

THE GUARDRAIL YOU MUST KNOW ABOUT

We have a hard internal rule: **no tradeable reward economy ships until three conditions are met** — (1) movement verification is genuinely reliable, (2) at least one city has real tile density, and (3) there is genuine sponsor or land demand. Until then, players earn XP and *locked* in-app credits that cannot be traded. This is written into our roadmap as a blocking gate, not a preference. It is the discipline the previous generation lacked, and it is what you should lead with if anyone asks whether we are "another move-to-earn".

Proof of movement: how we stop cheating

If someone can fake a walk, they can mint territory and tokens from their sofa, and the entire economy is worthless. This is the hardest technical problem in the product, and everything else depends on getting it right.

Nothing reaches the blockchain unless it has passed every check. The contracts are built to trust the proof, never the phone.

What each defence actually does

- **Speed gate.** Consecutive GPS points are checked against the time between them. Anything implying more than roughly 80 km/h is thrown out — that catches the simplest cheat, which is driving.
- **Accuracy gate.** Phones report how confident they are in each location fix. A session where too many points are vague gets rejected, because vague points are how spoofing tools hide.
- **Duration and continuity gates.** Sessions longer than 24 hours, or containing teleport-shaped jumps, are rejected outright.
- **Route fingerprinting.** The whole route is compressed into one unique fingerprint. Once that fingerprint has been used to claim something, it can never be used again — so you cannot record one good walk and submit it a hundred times.
- **The oracle signature.** Our verification service cryptographically signs approved routes. The contracts on Base will only act on a proof carrying that signature, so no one can submit a fake claim directly to the blockchain, bypassing our checks.
- **Economic caps.** Even a perfect cheat is bounded: there is a hard daily limit per account, and a zone requires a minimum number of *distinct* movers over 90 days before it becomes mintable at all. One person cannot manufacture a valuable district alone.

HONEST FRAMING

No GPS system on earth is perfectly spoof-proof, and we do not claim to be. What we claim is layered defence: several independent checks, each of which a cheater must defeat simultaneously, plus economic caps that make the effort not worth the reward. Verification is treated as a permanently ongoing investment rather than a solved problem, and it hardens as the network grows. If someone challenges you on this, that honesty is the strongest available answer.

What is already built

Most early-stage projects sell a vision. We have a vision *and* a substantial amount of working, tested infrastructure. Knowing exactly which is which is the most useful thing you can carry into any external conversation.

BUILT Smart contract suite

All eight contracts written, compiled, and **deployed to Base Sepolia** — Base's public test network — with 26 of 26 tests passing including a full end-to-end integration test. Every address and transaction hash is recorded and publicly verifiable on the block explorer. This is real, inspectable, third-party-checkable work.

BUILT Backend services

A working API with the GPS verification pipeline, hexagon computation, the oracle signing service, zone and battle endpoints, a job queue for processing routes, and a typed database layer with migrations.

BUILT Identity & wallet foundation

Full account, session, and wallet-linking infrastructure with a security-first design: fail-closed configuration, secure device storage, signed webhooks, audit logging, a documented threat model, and twelve architecture decision records. The provider is deliberately not yet switched on.

BUILT Mobile app shell & release pipeline

A working Android app with onboarding, sessions, XP, levels, streaks, a profile, clubs and territory-preview screens, plus an automated build pipeline that produces installable APKs. The design system is shared with the website.

BUILT Public site & documentation

A complete marketing site and a twenty-plus-page technical documentation set covering the whitepaper, product, protocol, economy, governance, security, privacy, risks and FAQ — all live.

IN PROGRESS The territory map in the app

Connecting the live GPS map and hexagon capture into the mobile app is the current build focus. The GPS, map overlay and wallet scaffolding already exist in the repository as a parked reference implementation to draw from.

The complete honest status table

Use this table rather than your memory when anyone asks what is live. Being precise here builds far more credibility than overstating.

CAPABILITY	STATUS	DETAIL
Smart contracts on Base test network	Built	8 contracts, deployed, addresses public
Contract test suite	Built	26/26 passing, incl. integration
GPS verification pipeline	Built	Backend service, checks + oracle signing
Hexagon territory computation	Built	H3 level 8, route → zone conversion
Account, session & wallet infrastructure	Built	Security foundation complete
Android app + automated release builds	Built	Installable APK pipeline working
Marketing site & full documentation	Built	Live and public
Live territory map inside the app	In progress	Current build priority — Phase 1
Embedded wallet provider switched on	In progress	Infrastructure ready, provider not yet wired
Clubs, city wars, seasons (live)	Phase 2	Screens designed; systems not live
Zone Deeds on Base mainnet	Phase 3	Deliberately gated — see the guardrail
Tradeable \$MOVE economy	Phase 3	Blocked until verification + density + demand
Community governance live	Phase 4	Contract deployed to testnet; not active
iOS app	Planned	Codebase is cross-platform; Android first

WHY THIS MATTERS FOR THE BASE BATCHES APPLICATION

Accelerators see hundreds of decks describing products that do not exist. Very few applicants can point to a deployed, tested, publicly verifiable contract suite on Base's own test network, a working verification backend, and a shipping mobile build pipeline — before asking for anything. **Our evidence is the strongest part of our application.** Lead with it.

Roadmap

We advance on evidence, not on a countdown. Each phase has to clear a specific bar before the next one starts — movement has to feel great before ownership goes live, and verification has to be sound before it carries real value.

Four phases, each gated on evidence. We are at the start of Phase 1 with Phase 3's infrastructure already built and tested.

Why the order is this way round

Notice something unusual: the blockchain work is largely done, but it is scheduled to go live *third*. That inversion is intentional and it is the most defensible thing about our plan.

- **A territory game needs neighbours.** Owning a hexagon means nothing if nobody will ever contest it. So density has to come before ownership, which means the free, wallet-free experience has to work first.
- **An economy needs sound inputs.** Switching on tradeable rewards before verification is genuinely hard to beat is how the previous generation destroyed itself. We would rather be late than exploited.
- **Sponsors need an audience.** Sponsored zones and city partnerships only have value once a city is actually being played in. Revenue follows density, not the other way round.

WHAT THE NEXT TWELVE MONTHS LOOK LIKE

Ship the live territory map and prove the capture loop feels good. Reach real density in a first city. Switch on the embedded wallet and put deeds in players' hands on testnet. Sign the first sponsor. Only then take the economy to mainnet — with the verification and density evidence to justify it.

How we get users

A territory game has an unusual growth property: it is *better* when your neighbours play, so it spreads geographically rather than randomly. That single fact shapes the entire go-to-market plan.

The core insight: density, not downloads

A hundred thousand users spread thinly across the world is a worse product than five thousand users concentrated in one city. Contested zones, rival clubs, and district wars all require neighbours. So our target metric is not total installs — it is **how many active players share a city**. Every growth decision follows from that.

Growth compounds locally. This is why we launch city by city rather than everywhere at once.

Seven channels, in the order we intend to use them

1 · Launch one city at a time

Pick a single city, concentrate everything on it, and do not move on until the map there is genuinely contested. A city with visible rivalry becomes its own advertisement — and gives us a repeatable playbook, a case study, and real density numbers to show partners. Diluting effort across ten cities gets you ten dead maps.

2 · Running clubs, walking groups and gyms

These groups already exist, already meet on a schedule, and are already competitive. They are the highest-leverage acquisition channel in the product because they arrive pre-formed: one club captain converts thirty players in one conversation, and thirty players in one neighbourhood is instant density. Clubs, crew missions and shared territory are built specifically to serve them.

3 · Zero-friction onboarding as a growth lever

This is not just a UX nicety — it is the difference between a 3% and a 40% conversion rate from install to first session. Every competing on-chain app loses most of its funnel at "write down these twelve words". We do not have that step at all. When someone shares MovenRun with a friend who has never used crypto, that friend can actually get in.

4 • The Base ecosystem

Base is actively looking for consumer applications that bring non-crypto users on-chain — that is precisely what Base Batches exists to fund. Being a visible flagship consumer app on Base gives us ecosystem promotion, developer community reach, and credibility with partners who already trust Coinbase. This is a distribution channel most consumer apps simply do not have access to.

5 • Local businesses and sponsored zones

A café can sponsor the zone it sits in. A gym can host an event zone. A council can sponsor a park trail. This is the same idea as a shop paying for a map pin, except players actively want to visit because it advances their game. It is our clearest early revenue line *and* a growth channel, because sponsors promote to their own customers. It also gives us a reason to be welcomed into a city rather than merely present in it.

6 • Territory is inherently shareable

A map of your neighbourhood shaded in your colour is a far better social object than "I walked 5 km". It is visual, personal, and immediately provokes the reaction we want: *"that's my street — why is it yours?"* Share cards are built into the session flow for exactly this reason.

7 • Seasons that reset the pressure

Ninety-day seasons give lapsed players a natural reason to return and new players a fair entry point where the map is not already permanently owned by veterans. Recurring competition is what keeps a network alive after the launch spike fades.

What we track

METRIC	WHY IT IS THE ONE THAT MATTERS
Active players per city	Our real growth number. Density, not downloads.
Contested zone ratio	What share of zones have more than one mover. This is the health of the game.
Install → first session	Directly measures whether frictionless onboarding is working.
Week-4 retention	Habit formation. A movement product lives or dies here.
Sessions per active week	Consistency beats intensity, so frequency matters more than distance.
Club participation rate	Social users retain dramatically better than solo ones.

Why us, why now

The idea of turning movement into a map game is not secret. The reason it has not been done properly is that it requires three hard things to be true at the same time — and only recently have all three become possible.

Now is possible

Only in the last couple of years have embedded wallets and sponsored fees matured enough to hide crypto completely. Two years ago this product would have required every user to buy a token before their first walk. That is what changed.

Now is affordable

Fees on Base are a fraction of a cent. A game generating thousands of small on-chain actions per day is economically viable for the first time. On the base layer it never was.

Now is credible

The move-to-earn collapse taught the whole market what not to do — and left a large audience that liked the idea and lost trust in the execution. A version built with discipline lands into a market that already understands the pitch.

What we bring that a well-funded competitor would not

- **We built the hard part first.** Most teams build the app and bolt on the blockchain later, discovering too late that verification and economics do not work. We deployed and tested the contract suite, the oracle and the verification pipeline before asking anyone for money — which means our economic design has been pressure-tested against real code rather than a spreadsheet.
- **We have a written guardrail we actually enforce.** Our own internal rules block a tradeable economy until verification, density and demand are all proven. That is written into the canonical scope document that governs every decision. Discipline is a competitive advantage in a category that died of the lack of it.
- **We designed for the non-crypto user from the first line of code.** Not as a later "onboarding improvement" but as the founding constraint. The consequence shows everywhere: no wallet in the core loop, game words instead of crypto words, and the whole thing playable for free.
- **We are health-first, and mean it.** A 20-minute walk is a first-class move. There is no minimum speed and nothing that rewards risky behaviour. That decision costs us the "hardcore athlete" audience and buys us everyone else — which is a far larger market and a far more retentive one.
- **We are documented to an unusual standard.** A public whitepaper, a full technical documentation set, a threat model, a security checklist, twelve architecture decision records, and a contracts audit document. This matters because it means a new partner, an investor, or an auditor can verify our claims rather than trust them.

Where the money comes from

REVENUE LINE	PHASE	DESCRIPTION
Sponsored zones	Phase 3	Local businesses, gyms, councils and brands pay to sponsor specific zones or areas. Our clearest and most defensible early line.
Deed marketplace fees	Phase 3	A small fee on territory that changes hands between players.
Premium tools	Phase 3	Paid features for committed players and deed holders — analytics, planning, advanced club tools.
Events & partnerships	Phase 4	City events, brand activations, and limited-time map takeovers.

Note the pattern: every line is paid by a business or a committed player, and none of it depends on ordinary users spending money. The free experience stays genuinely free — which is what protects our growth engine.

THE ONE-SENTENCE PITCH

MovenRun is the first movement game where the ground you cover becomes property you genuinely own — built on Base so it settles in seconds for almost nothing, and engineered so that the person walking never has to know any of that is happening.

Risks, stated honestly

You will be asked about these. Answering them openly is far more persuasive than deflecting — and as a partner you need to know what could actually go wrong.

RISK	THE HONEST PROBLEM	HOW WE ADDRESS IT
Movement spoofing	Location can be faked with widely available tools. An economy built on movement must resist people who never leave their sofa.	Layered defence — plausibility checks, deterministic route fingerprints, replay blocking, oracle attestation, hard daily caps, and a minimum number of distinct movers before a zone becomes valuable. Treated as permanently ongoing work, never "solved".
Economic balance	Movement economies have collapsed when incentives outran real utility. Ours could too if we got the parameters wrong.	Utility-first design: capped and decaying issuance, sinks decided before incentives, and a hard gate blocking any tradeable economy until verification and density are proven. Parameters are adjustable through governance rather than fixed forever.
Smart-contract security	On-chain code is unforgiving. A bug can be irreversible and expensive.	Standards-based contracts rather than reinvented primitives, narrowly-scoped roles with no single all-powerful key, timelocked governance, a documented threat model, and defence in depth. A full external audit is a prerequisite for mainnet.
Adoption density	A territory game with no neighbours is a lonely map. This is our biggest commercial risk, not a technical one.	Frictionless onboarding to reach beyond crypto natives, a game that is still rewarding solo, and a deliberate city-by-city rollout that builds density before it is needed rather than hoping for it.
Regulation	Rules for digital assets differ by country and keep changing. Some jurisdictions may restrict parts of the model.	A design centred on utility and ownership rather than financial return, no promises of income anywhere in our materials, transparent on-chain governance, and a phased rollout that can adapt market by market.
Location privacy	Movement data is among the most sensitive data that exists. Mishandling it would be both a harm and an existential reputational risk.	Proofs rather than permanent trails, data minimisation by design, no third-party ad tracking, no selling of location profiles, no exposure of anyone else's precise position, and user control over their own assets and keys.
Battery and phone reliability	Continuous GPS drains batteries and behaves differently across hundreds of Android devices.	An engineering priority for Phase 1: sampling tuned for battery, graceful handling of GPS gaps, and sessions that survive interruption. This is a known cost of the category, and it must be solved before scale.
Crypto's reputation	Many people have a negative association with the word, often justified. It can cost us mainstream users before they try anything.	We lead with movement, health and territory. Crypto is never the pitch — it is the mechanism, and it stays invisible. Our public language avoids financial promises entirely.

THE UNCOMFORTABLE ONE

The largest risk is not technical at all — it is that we build an excellent product and cannot reach density in a first city. Everything in Section 13 exists to attack that specific risk, and it is the one we will be measured on first. If you take ownership of one problem in this business, that is the one worth taking.

Glossary

Every term you will hear, in one line each. Keep this page bookmarked for your first few weeks.

Account abstraction

The technology that lets us pay blockchain fees on a user's behalf, so they never buy a token.

Base

The blockchain we build on. A fast, cheap Layer 2 built on Ethereum and operated by Coinbase.

Base Sepolia

Base's public test network. Functionally identical to the real thing but with valueless tokens. Our contracts are deployed here.

Blockchain

A shared record book that no single company owns and nobody can edit after the fact.

Burn

Permanently destroying tokens, removing them from supply forever. Our main way of keeping the economy tight.

Club

A team of players whose captures contribute to shared territory and a shared leaderboard position.

Contested

A zone someone has formally challenged. It changes hands unless the current holder defends it.

DAO

"Decentralised autonomous organisation" — governance by token-holder vote rather than by a company.

District

A group of neighbouring zones. Holding a critical mass of one earns mastery and standing.

Dormancy

A zone left untouched too long can be flagged and eventually reclaimed, so the map does not freeze.

Embedded wallet

A wallet we create and secure for the player automatically. No seed phrase, no setup.

Ethereum

The largest programmable blockchain. Base settles down to it, inheriting its security.

Gas

The small fee for writing to a blockchain. We sponsor it so players never see it.

Gear

Collectible items — shoes, jacket, watch, headband — that boost what a session earns, up to a capped limit.

Great Burn

An end-of-season event that destroys a portion of accumulated yield from the most active zones.

H3

The open hexagon grid system, originally from Uber, that we use to tile the entire planet.

Hex / zone / tile

Three words for the same thing: one hexagonal cell of the map, roughly 0.74 km².

Layer 2

A fast, cheap network built on top of Ethereum that periodically settles down to it. Base is one.

Locked MOVE

Non-tradeable in-app credit earned before the real economy launches. Deliberately not a payout.

Mainnet

The real blockchain network where assets have real value — as opposed to a test network.

Mint

To create something new on the blockchain: a token, or a deed for a zone.

\$MOVE

Our token. Minted by verified movement, spent on claiming, upgrading, challenging and staking.

NFT

A unique, individually identifiable record of ownership. Ours are Zone Deeds — think title deed, not cartoon.

Oracle

The service that bridges the real world and the blockchain by signing off on verified routes.

Private key

The secret that proves ownership of on-chain assets. Whoever holds it controls them.

Proof of movement

The verified, signed evidence that someone genuinely moved. The foundation of the whole economy.

Season

A 90-day competitive cycle with its own objectives, standings and settlement.

Self-custody

Holding your own private key, so no company can touch your assets. Optional in MovenRun.

Smart contract

A program that lives on the blockchain and runs exactly as written, the same way for everyone.

Staking

Locking tokens for a period to back the network and gain a voice in governance.

Testnet

A practice blockchain where tokens are worthless, used to prove software works before real value is at stake.

Timelock

A mandatory delay between a governance vote passing and it taking effect, so the community can react.

Wallet

Not a container — a key. It proves which on-chain assets are yours.

Zone Deed

The on-chain record of owning one specific hexagon. Our core asset.

Zone tax

2% of everything minted inside a hexagon is credited to that zone's deed holder.

Your first two weeks

A practical onboarding path. The goal by the end of week two is that you can explain MovenRun to a sceptical stranger without notes, and have an opinion about what we should do next.

Week 1 — Understand the product

- ☐ Read this document end to end, then read Sections 5 and 9 again.
- ☐ Install the current build and complete several sessions yourself. Nothing substitutes for feeling the loop.
- ☐ Read the public site and documentation as an outsider would, and note every sentence that confused you — those notes are genuinely valuable while your perspective is still fresh.
- ☐ Walk one of your own regular routes and sketch which zones you would capture. It makes the abstraction concrete.
- ☐ Write your own one-paragraph explanation of MovenRun without looking at ours, and compare.

Week 2 — Pressure-test it

- ☐ Explain the product to three people who have never used crypto. Write down every objection verbatim.
- ☐ Go through the honest status table in Section 11 until you can recall built-versus-planned without checking.
- ☐ Look at one competing movement app and form a view on what they do better than us.
- ☐ Pick a candidate first city and make the case for it: population density, walking culture, existing club scene, local business appetite.
- ☐ Bring back the single hardest question you were asked that we do not yet have a good answer to.

The four things to be able to say without hesitating

1. **What MovenRun is** — "You walk, you capture hexagons on a map of the real world, and the territory becomes genuinely yours."
2. **Why crypto is involved** — "So that ownership is real and can't be revoked, including by us. That's the only reason it's there."
3. **Why it won't repeat the last collapse** — "The ways money leaves the system were designed before the ways it enters, and we've blocked any tradeable economy until verification and density are proven."
4. **What is actually built** — "Eight contracts deployed and tested on Base's test network, a working verification backend, and a shipping mobile build. The live territory map is what we're building now."

A NOTE ON WHAT YOU BRING

Coming from outside crypto is an advantage in this role, not a gap to close. Almost everyone we need to reach is also outside crypto, and the failure mode of this industry is people who cannot remember what it was like not to understand it. If a section of this document was hard to follow, that is a product insight — please treat it as one and tell us.

MovenRun — Partner Onboarding Brief, v1.0 · August 2026. Confidential and prepared for internal partner onboarding. MovenRun is a development-stage product; features, parameters and timelines described here may change. Nothing in this document is financial advice, an offer, or a promise of returns. Digital territory is a game asset, not real-world property. MovenRun encourages regular activity, which is generally healthy, but it is a game rather than a medical service and does not diagnose, treat or prevent any condition.
